

Product update: CrowdRoaming app now available for Android 4.1 and higher

Leiden, the Netherlands – 10 September 2013 – CrowdRoaming.com releases a major update of their innovative, community-based app. The update enables owners of smartphones with Android 4.1 and higher to now also actively make available a portion of their unused mobile data to friends, family or fellow travellers abroad.

In July of this year the company introduced their new mobile data sharing concept in beta-version for a limited number of Android versions. "As most new Android smartphones make use of the 4.1 or higher operation system, we are proud to be able to make the app available for these new users now as well and let them join the CrowdRoaming community," says Hodayun Zahidi, CEO of CrowdRoaming.com.

CrowdRoaming enables local residents and users of the app to provide their unused mobile data, safely and free of charge, to visitors and tourists in their country. In return, these users can benefit from using the mobile data of others when they are abroad themselves. To use this service, you only have to download the CrowdRoaming app. All the work is done by the app itself, which runs in the background and automatically seeks nearby smartphones to connect with.

Besides preventing high roaming costs, the app also responds to a new trend that is associated with the current economic situation, which is the 'economy of sharing'. "Sharing is the new owning, and the popularity of services like Couchsurfing or Airbnb is growing. With CrowdRoaming people do not only avoid high costs but do someone else a favor as well," says Hodayun Zahidi. "With CrowdRoaming we see the possibility to connect the philosophy of give and take with a new mobile technology and we are very proud of the result."

CrowdRoaming is available in Google Play store.

Connect and Share. Give and Take
